

Father's Day: Men with no sperm can become fathers too

The technical advancements and recent research developments in the medical field have made procreation possible for men with less or no sperm count. In medical terms, this condition is commonly known as Azoospermia since it is associated with very negligible or no sperm in the semen. Procedures availableSome commonly known procedures available are Testicular Sperm Aspiration or TESA, Percutaneous Epididymal Sperm Aspiration (PESA), Percutaneous Biopsy of the Testis (Perc Biopsy), and Microsurgical Epididymal Sperm Aspiration (MESA). The Perc Biopsy is a similar technique done with a bigger needle to extract more sperm. In conclusionThere is a study which shows that such procedures involving sperm aspiration have a 70% chance of fertilizing an egg successfully even when the sperm quality is quite low.
